

# E-Commerce Sales Performance Analysis

Executive insights drawn from 5,000 orders — uncovering what's working, what's not, and where to act next.

# Dataset Overview

## 5,000 Orders

Comprehensive order-level data analyzed across all product categories

## 12 Dimensions

Order details, customer metrics, and full transaction data captured

## Zero Gaps

Clean, complete dataset — no missing values, no assumptions required

# Key Performance Metrics

6.08

**Days Avg. Delivery**

Significantly above customer expectations  
for modern e-commerce

2.96★

**Customer Rating**

Out of 5 stars — a red flag signaling  
widespread dissatisfaction

1,000

**Active Customers**

Total active buyer base across all categories  
and regions

A 2.96-star average rating is a critical signal — at this level, churn risk is elevated and requires immediate investigation.

# Revenue Leaders by Category

## Who's Driving the Numbers

**Clothing and Electronics** dominate revenue performance, standing clearly ahead of all other product categories. Regional variation is equally pronounced — one region is delivering a disproportionate share of total revenue, signaling both a concentration risk and an untapped opportunity in underperforming markets.

- Clothing and Electronics are clear top-two revenue contributors
- Significant variation across regions in category mix
- One region drives outsized revenue concentration

# Category Performance Breakdown

## Clothing

Top revenue generator across the dataset. Strong and consistent customer demand makes this the anchor category for growth investment.

## Electronics

Second-highest performer, buoyed by premium pricing. High transaction value per order drives meaningful revenue contribution.

## Other Categories

Lower volume today, but represent an untapped growth opportunity with the right promotional and inventory strategy.

# Critical Issue: Low Customer Ratings

An average of **2.96 stars** is not a minor gap — it is a business risk. At this level, customers are actively dissatisfied and at high risk of churning to competitors.

## Likely Drivers

- Delivery delays exceeding expectations
- Product quality inconsistencies
- Service or post-purchase experience gaps

## Why It Matters

- Low ratings suppress repeat purchases
- Negative word-of-mouth erodes new acquisition
- Immediate action is required to prevent further churn

# Delivery Performance Gap

## The Ripple Effect of Slow Delivery

At **6.08 days**, average delivery time is a primary driver of poor customer experience. In a market where 2–3 day delivery is the norm, this gap directly suppresses ratings and repeat purchase behavior.

- Slower delivery correlates with lower satisfaction scores
- Impacts willingness to return and repurchase
- Logistics optimization is the highest-leverage short-term fix

# Business Recommendations

## 1 Reduce Delivery Time

Streamline logistics operations and explore carrier partnerships to close the gap between current 6.08-day average and customer expectations.

## 2 Boost Top Categories

Increase marketing investment in Clothing and Electronics — the proven revenue engines — to maximize returns from high-demand segments.

## 3 Launch Customer Feedback Program

Deploy a structured survey to uncover the root causes behind the 2.96-star rating and build a clear action plan to address dissatisfaction.

# Next Steps

📌 Success depends on speed of execution. The data is clear — the priority actions are delivery and customer experience, starting now.
